

1 DR. KARELLAS: Andrew Karellas. We heard  
2 comments about the importance of the medical audit,  
3 and there is no question about that. And we all  
4 understand, and we all know that this is an extremely  
5 critical part. And this is not the medical audit  
6 versus the physical evaluation, or the physics work,  
7 or the technologist's work. There is valuable time  
8 spent on that part, but I don't think it's because we  
9 do not have the answers from the medical audit. It's  
10 not because we don't have the time. It's because we  
11 cannot come up with a solution.

12 There is time available, but it is very  
13 difficult to find a good way of doing it. And I would  
14 like to remind us that as important as the medical  
15 audit is, and all these issues with radiologists and  
16 perception, and they are critical issues, if the  
17 technologist does not deliver you a good image, and if  
18 you do not have an effective quality assurance  
19 program, you will not have anything of much value at  
20 the end of the pipeline for the radiologist to review.  
21 And that's very important to remember. It is good to  
22 streamline certain operations from the technical end,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 recordkeeping procedures, physics, technologists, and  
2 we all agree. In fact, many technologists and  
3 physicists agree in the streamlining part, but that's  
4 still a very critical part of the whole process.

5 CHAIRPERSON HARVEY: And you have to  
6 acknowledge it's difficult to maintain a high standard  
7 day after day. There's so many pressures, there's so  
8 many patients, so much to be done. People are cutting  
9 back. Mammography faces a lot of issues of this  
10 nature that make the day by day activities more  
11 difficult. Any other comments on other alternatives,  
12 or other ideas? Well, we've had some really excellent  
13 ideas, and we've all been listening carefully to them.  
14 And hopefully, the FDA people have been also, because  
15 it's not easy to make any changes.

16 Everything is a balance. I was explaining  
17 this as a force forward for those of you who may have  
18 had physics a long time ago, when I did. Everything  
19 is balanced. You have different weights and different  
20 pressures on mammography, and we've come to some  
21 particular equilibrium. Now if we want to switch,  
22 there will need to be some negotiations as to where

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1       that equilibrium will be found. And some people are  
2       moving towards digital very rapidly, but we have many,  
3       many small rural facilities that won't see anything  
4       like digital unless there's some breakthrough that  
5       makes them much less expensive, and people buy their  
6       piece of equipment and they keep it. And it will last  
7       for quite some time, particularly in some of the  
8       smaller facilities where it doesn't have the burden of  
9       heavy use. So it will be quite a long time, I think,  
10      before that viewbox is dusty in some of the more rural  
11      towns. Ms. Martin, did you have something?

12                   MS. MARTIN: Well, I'd just like to  
13      follow-up on the lady from Missouri that spoke about  
14      viewboxes. If there's anything else that is currently  
15      being covered by the ACR program but it's obviously  
16      voluntary as opposed to mandated, the viewbox  
17      conditions probably have the greatest effect on what  
18      is visualized out there. If there's anything that's  
19      going to be picked up at all, if we could incorporate  
20      some viewbox requirements - the viewing conditions are  
21      all over the place.

22                   CHAIRPERSON HARVEY: Yes. Dr. Karellas.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 DR. KARELLAS: Andrew Karellas. I totally  
2 agree with that. If inspectors were testing  
3 viewboxes, they would find quite a few incidents of  
4 non-compliance. It's a significant issue. And, in  
5 fact, from my point of view, as much as I don't like  
6 inspectors going in and inspecting everything  
7 physically, I don't think it's a bad thing to go to  
8 one randomly and test and say well, this is not in  
9 compliance. And I think they will probably be ahead  
10 of the physicists and technologists on occasion,  
11 because if the physicist there is once a year or twice  
12 a year, you are not going to catch that very easily.

13 CHAIRPERSON HARVEY: Excellent. I think  
14 we'll have a break. We'll be back in about 10  
15 minutes. Thank you.

16 (Whereupon, the proceedings in the above-  
17 entitled matter went off the record at 2:43 p.m. and  
18 went back on the record at 2:58 p.m.)

19 CHAIRPERSON HARVEY: On the record. Our  
20 next section has to do with the use of digitized film  
21 screen mammograms and compressed FFDM digital data.  
22 I believe we have a speaker, Mr. Robert Phillips.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Welcome.

2 DR. PHILLIPS: Thank you. Good morning or  
3 afternoon now. When Charlie Finder asked me to do  
4 this talk, he described a little bit of what he  
5 wanted. I apologize. The title is a little bit  
6 different, but it will get to the same point. If I  
7 tell you something you already know, I apologize. If  
8 I don't cover something that I should, please ask  
9 questions and we'll get something done.

10 I want to talk today about medical device  
11 regulation of PACS devices. That includes digitizers  
12 and compression schemes and all sorts of things like  
13 that. By the way, if you don't know me, I'm Chief of  
14 the Radiological Devices Branch. I'm in the Office of  
15 Device Evaluation. Our job is to approve new medical  
16 devices under the Medical Device Law.

17 Let me outline what I want to talk about  
18 first; the process of device classification. Then I  
19 want to go on to various market clearance processes,  
20 what we did to the PACS, the classification regulation  
21 of PACS, and then discuss some of the issues with  
22 compression, then on to digitizers, then full field

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 digital mammography approvals. Hopefully I can do  
2 that in about 15 minutes. Then you can ask me lots of  
3 questions afterwards.

4 Device classification is founded in the  
5 Medical Device Amendments which were passed in 1976.  
6 Since then, the amendments have been revised several  
7 times but still basic to it is all devices that were  
8 on the market prior to 1976 were grandfathered. These  
9 grandfathered devices were placed into three  
10 classifications. This was done on a device category  
11 basis with the assistance of an advisory panel. Most  
12 of it was done back in the late seventies and early  
13 eighties.

14 The device classification system created  
15 three classes. The first class was general controls.  
16 These are things like GMPs, good manufacturing  
17 practices, submitting 510(k)s, having a recall or a  
18 malfunction file, things like that, basically low risk  
19 devices. Since then, the amendments to the Food,  
20 Drug, and Cosmetic Act have resulted in most of these  
21 devices being exempt from submission of 510(k) which  
22 I'll get to in a little bit.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1           Class 2 devices are one step up. They are  
2           devices that need general controls and special  
3           controls in order to assure their safety and  
4           effectiveness. There, originally, the special  
5           controls were standards. But the process for  
6           developing standards was very complex such that  
7           essentially none were promulgated.

8           What happened instead is Congress came  
9           back and changed it from standards to special  
10          controls. These now allow the use of voluntary  
11          standards - a company can use those - other processes  
12          which again assure safety and effectiveness.

13          The last category was for the devices that  
14          were most critical in terms of safety and  
15          effectiveness; implants, life-sustaining, and any  
16          device that could not be shown safe and effective  
17          since 1976, some device that's been on the market.  
18          For these, a PMA is necessary. I'll get to PMAs in a  
19          moment.

20          The 510(k) process primarily applies to  
21          Class 1 and 2. It applies to some pre-amendments  
22          Class 3 devices, but most of those at this point we

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 have asked for PMAs for so that's dropping away. The  
2 basis of a 510(k) clearance is the new device is shown  
3 to be substantially equivalent to a device that's  
4 already on the market. Originally, it was  
5 substantially equivalent to a device that was on the  
6 market prior to 1976. But by extension, that was  
7 changed to any device that's already being marketed.

8 It is essentially a need-to process. The  
9 manufacturer of the new device shows that his device  
10 is substantially equivalent to the old device. This  
11 does not mean it is identical. It means it's  
12 substantially or in the most part equivalent. One of  
13 the derivatives of this is that the new device is no  
14 more safe or effective than the old device that was on  
15 the market.

16 If someone came in tomorrow and wanted to  
17 market an old flat-plate fluoroscope, we would have no  
18 legal basis for not approving it under the Medical  
19 Device Laws. I doubt that they would sell many of  
20 them, but that just gives you the background.

21 In the 510(k) process, technology creep  
22 can occur. Again, the device is not identical. It's

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 substantially equivalent. As changes are made, a  
2 whole series of minor changes can be made. At some  
3 point, you look back and say, "Gosh, the new device  
4 I'm looking at is really not the same as the original  
5 device was on the market." But that's just recognized  
6 as being part of the process.

7 In the 510(k) process, there's no  
8 requirement for the new device to be better than the  
9 old device. That means that the 510(k) process will  
10 not improve the breed, if you will. The device again  
11 need only be as safe and effective as the predicate  
12 device. Just for numbers, we clear about 4,000  
13 510(k)s per year. That's over about five or six  
14 different medical specialty areas.

15 The PMA process is different. In this  
16 process, the device is shown to be safe and effective.  
17 It's no longer substantially equivalent. It is safe  
18 and effective on its own right. The device is not  
19 judged in comparison to any other device, only on its  
20 own characteristics. Full field digital mammography  
21 has been going through the PMA process. I'll explain  
22 that a little bit later.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1           The Center approves about 35 to 50 pre-  
2           market approvals or PMAs per year. As a benchmark,  
3           when we are estimating our time, we estimate it takes  
4           a reviewer about a week to do a 510(k). A PMA  
5           accounts for about one-half person year. That's  
6           generally a team review over a multitude of various  
7           specialties.

8           PACS is a device that was classified about  
9           15 years ago with the rest of our radiological  
10          devices. At the time we were looking at PACS, it was  
11          determined that it was a pre-amendments device. There  
12          were devices that could be called PACS or image  
13          reviewing-type systems that were on the market prior  
14          to 1976. These were analog. Since then, it's all  
15          converted over to digital but the concept was the  
16          same.

17          We looked at these. We divided the  
18          hardware up into five different categories. The first  
19          was the PACS workstation itself. This is the thing  
20          that you use in your practice. It's the business end  
21          of the process. It includes the CRTs, the software,  
22          and it's the PACS device that allows you to manipulate

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 the image, change the contrast, change the gray scale  
2 range, enhancement if you want, all sorts of things  
3 like that.

4 Communications were the second device.  
5 These are the things like modems and transmission  
6 lines and things like that. Data storage devices were  
7 the third. These would be magnetic disks, CDS, large  
8 optical disks, any sort of process that's used for  
9 storing digital data.

10 The next was the hard-copy output devices.  
11 I heard someone earlier talking about printers.  
12 Printers are the major product here. Then the last  
13 item that we looked at was digitizers. These are  
14 devices which can take an analog or continuous tone-  
15 type image and convert it into a digital array that  
16 represents that image.

17 The communications and storage devices  
18 were put into Class 1. They are exempt from 510(k)  
19 submission. That means that the manufacturer does not  
20 have to come to the agency to put one of these on the  
21 market. There are still other requirements such as  
22 records and good manufacturing practices and things

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 like that that apply.

2 But our thinking when we did this was that  
3 the communications technology and the storage  
4 technology is really dominated by the computer  
5 industry and not by the medical device community.  
6 What has happened in that area is far beyond our  
7 ability to influence it.

8 Hard copy, digitizer, and PACS  
9 workstations were placed into Class 2. In this case,  
10 a 510(k) submission is necessary. We felt the device  
11 operation here was critical to the diagnostic process  
12 so that issues of safety and effectiveness were  
13 present. Up to now, most of these devices have been  
14 marketed with a general claim, that is, they can be  
15 used to, let's say, manipulate radiographic images.

16 Let's go into compression for a minute.  
17 We have two types of compression that we're concerned  
18 about. One is called lossy compression. The other is  
19 non-lossy compression. In non-lossy compression, the  
20 data is to be restored so that it is essentially  
21 identical to the original whereas with non-lossy  
22 compression, there is a loss of information that is

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealgross.com](http://www.nealgross.com)

1 irrecoverable.

2           When we were working on this originally  
3 about 15 years ago, a standard then was that about a  
4 four to one compression ratio was about the maximum  
5 you could go without starting to lose significant  
6 data. With the advent of some of the newer techniques  
7 such as the JPEG 2000 technique, that ratio has gone  
8 up. Now I'm told you can have compression ratios up  
9 to 40 to one without significant loss of information.

10           Unfortunately, there is very sparse  
11 literature in the medical libraries on what it means  
12 to have lossy compression. No one that I'm aware of  
13 has gone and done a series where they had different  
14 degrees of data loss and determined what the final  
15 diagnostic outcomes were. So that's a big unknown  
16 right now. As I indicate here, compression greater  
17 than four to one in the past was a big deal.

18           When we approve or clear devices that were  
19 involved using lossy compression, we require that at  
20 the point that the lossy compression was applied all  
21 derivative images, whether they were looked at either  
22 on a soft copy like a CRT or on a hard copy like a

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 printed version, would have to have some sort of  
2 annotation attached indicating that the image had  
3 undergone lossy compression. That way, anybody  
4 looking at that film would know that they were not  
5 looking at a complete original data set. That is  
6 continued up to now.

7 Newer technologies are coming along quite  
8 rapidly. The newest standard for compression is  
9 currently called JPEG 2000. It uses a process called  
10 wavelets which I won't go into. But as I indicated,  
11 some of the other newer technologies can allow some  
12 very, very high compressions. Again, these usages are  
13 pretty much general claims. We have not cleared any  
14 lossy compression device for use with mammography that  
15 I'm aware of.

16 What you might be unaware of though is  
17 that in using public transmission lines and other  
18 things - and this was more applicable to analog images  
19 than to digital - many of the public transmission  
20 lines, the telephone company and so on, use their own  
21 compression audit rhythms to maximize the use of the  
22 band spread in their signal communication systems.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 When you are using public transmission systems,  
2 there's a potential for compression to be hidden in  
3 the transmission process itself.

4 This is just an example of what  
5 compression looks like. (Indicating.) This is an  
6 original photograph. This is the same photograph  
7 using the old standard, JPEG, after reconstruction  
8 from 40 to one compression. You can see you have lost  
9 a significant amount of detail. The image is blocky.  
10 There is a distinct loss of acuity for the whole  
11 image. I won't say any more.

12 Here is the same image using the JPEG 2000  
13 restored from 40 to one compression. If you compare  
14 the two images, you can see they are pretty close.  
15 They are not perfect. If you go up and look at this  
16 carefully, you will see there is still some fuzziness  
17 that's introduced and so on. But it certainly is a  
18 major improvement from the old JPEG which is this  
19 image here. This will be made available in the  
20 proceedings of this meeting. If you have an interest  
21 in compression references, here are a few that we have  
22 put together. As I say, they will be made available.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1                   Digitizers, as I indicated, are also Class  
2                   2 device. They are used to convert a conventional  
3                   image into a digital image. The primary usage has  
4                   been in radiography for allowing old analog images,  
5                   continuous tone images, what you see on your X-ray  
6                   that you put up on the screen, allowing them to be put  
7                   into a digital database for future manipulation.

8                   They are also used as a precursor to some  
9                   CAD devices. Again, all the CAD devices work on a  
10                  digital basis not on an analog basis so that prior to  
11                  using one of the CAD devices, the first step is to  
12                  take your X-ray and digitize it. They are cleared  
13                  with the general indication for use.

14                 Again, to my knowledge, we have not  
15                 cleared any for specifically mammographic use. I'll  
16                 have a caveat there, except for the CAD devices where  
17                 you are not working with an original data set where  
18                 you are going to do a diagnosis. If you recall, for  
19                 our CAD devices, the labeling says that the first  
20                 thing you do is your normal diagnosis of the film and  
21                 then use the CAD devices to help you almost as a  
22                 second reader.

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 Full field digital mammography has been on  
2 the market now since about 1997 or so. It's been very  
3 interesting for us. First of all, there's no  
4 consensus on what technology is being used or going to  
5 be used for digital mammography. That creates one of  
6 the problems in trying to develop for MQSA a QC  
7 program because each system at this time is  
8 essentially unique so that the QC programs have to be  
9 developed for each specific system.

10 We originally tried to clear these devices  
11 under the 510(k) process but were unable to establish  
12 the substantial equivalents between the digital films  
13 and the continuous tone analog films primarily because  
14 the inter- and intra-reader variability was so high  
15 that in order to get statistical significance, you  
16 would have to have study populations of tens of  
17 thousands of patients. The result was that the three  
18 devices had been approved under the PMA program which  
19 allows us to prove something based on its own safety  
20 and effectiveness rather than by comparison to  
21 something that's already on the market.

22 Again, as I commented, the MQSA QC is

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 based on the individual testing provided by the  
2 sponsor. We as yet do not have any general approach  
3 for quality control. Charlie, that's about the end of  
4 it. I'm available for questions.

5 CHAIRPERSON HARVEY: Questions from the  
6 Committee? Ms. Martin.

7 MS. MARTIN: Is it your department that  
8 will be setting the standards, if any, for monitors  
9 that are to be used for mammography for PACS systems?

10 DR. PHILLIPS: We approve monitors but for  
11 PACS system, probably yes. There's a lot of work  
12 going on right now trying to figure out what's good,  
13 what's bad, or what's good for mammography, what's not  
14 good for mammography. We have tried to set the  
15 benchmark at five megapixels and above for mammography  
16 use.

17 MS. MARTIN: And with that, is your  
18 department going to establish the testing procedures  
19 or are you going to follow a lot of what's in the AAPM  
20 task group reports? In other words, where is this  
21 correlation going to happen for the physicist and the  
22 testing that will be done on these monitors and the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 standards? In other words, what do we judge them  
2 against?

3 DR. PHILLIPS: The AAPM is not a standard  
4 setting organization. What they do is provide  
5 standards of practice for their membership. We have  
6 been asking them for a long time to try and change  
7 that because a lot of what they are doing is very  
8 useful, as you just indicated.

9 We would work with AAPM. We would work  
10 with NEMA. We would work with the various scientific  
11 organizations. We have members that sit on various  
12 standards and international standards organizations.  
13 That is probably the mechanism that we'll use to  
14 develop some sort of standard. We'll work with, let's  
15 say, an IEC standards group. When they promulgate a  
16 standard, if it meets our needs, we would then endorse  
17 it and it becomes usable in the 510(k) process.

18 CHAIRPERSON HARVEY: Dr. Karellas.

19 DR. KARELLAS: Andrew Karellas. Do you  
20 have a set of requirements or do you envision a set of  
21 requirements that somebody could submit to you for  
22 doing lossy compression for digital mammograms?

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 That's the number one question. Two is, would that  
2 have to be done separately for different data sets  
3 from different manufacturers?

4 DR. PHILLIPS: I don't know about the  
5 different data sets. At this point, no, we do not  
6 have a set of requirements. We honestly don't even  
7 know what to evaluate when you are talking about that.  
8 If someone wanted to come in with a lossy compression  
9 process for mammography, first of all, we have to work  
10 with Dr. Finder on this because it affects MQSA also.  
11 But most likely, it would end up being a rather large  
12 clinical study where you would assess the clinical  
13 outcome versus the degree of data loss. I don't see  
14 that as being a really simple study to do yet.

15 DR. KARELLAS: Thank you.

16 CHAIRPERSON HARVEY: Any other questions?

17 MS. MARTIN: I have one more question. I  
18 guess maybe I'm missing something here. So at this  
19 point, there are no specifications or any monitors  
20 that are permitted to be used for mammography  
21 interpretation other than those that are sold and  
22 integrated basically with the three manufacturer

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 systems. Assuming that is the case, do you have any  
2 time frame as to when that will change?

3 DR. PHILLIPS: No, I didn't say there were  
4 no monitors. There are monitors that we have approved  
5 for mammography use.

6 MS. MARTIN: Okay.

7 DR. PHILLIPS: We're using right now the  
8 category of five megapixel and above. Plus, we asked  
9 for a whole slew. There's an IEC standard on  
10 monitors. We're asking for that data to be calculated  
11 out and provided to us.

12 MS. MARTIN: Okay.

13 DR. PHILLIPS: Digitizers and lossy  
14 compression are the areas where we have not had any  
15 mammographic use.

16 MS. MARTIN: Is this the question then?  
17 My question came up a while ago about whether the  
18 digitized films are going to be accepted or is that  
19 later?

20 DR. FINDER: If you are done asking Dr.  
21 Phillips questions, we're going to get started with  
22 the discussion right now if that's okay.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 DR. PHILLIPS: Lead on.

2 DR. FINDER: So with Dr. Phillips'  
3 presentation and the early public speakers'  
4 presentations as background, we're going to be asking  
5 the Committee to discuss the use of digital data  
6 compression in order to reduce the size of full field  
7 digital mammo files, in order to make storage of  
8 images in PACS more economical, and also the use for  
9 transmission of images to remote reading sites  
10 feasible. There's also increasing interest in the  
11 mammographic community in digitizing screen film  
12 images so that they can be stored electronically and  
13 transmitted also for remote reading.

14 We're going to be asking the Committee to  
15 discuss some of these issues that I'm going to talk  
16 about right now and whatever else they come up with;  
17 the risks and benefits of allowing such practices, how  
18 such practices could affect the quality of the images  
19 being evaluated and the ultimate clinical outcomes,  
20 how such digital data could impact the performance of  
21 adjunct devices such as computer-aided detection and  
22 computer-aided diagnosis devices, and then getting

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealgross.com](http://www.nealgross.com)

1 back to a more fundamental question of, what methods  
2 can FDA and the public be assured that such practices  
3 ensure adequate image quality?

4 So one of the issues that we're talking  
5 about is, how can FDA take a compression algorithm,  
6 take a digitizer and say without having to go through  
7 huge clinical trials that this will ensure adequate  
8 safety and effectiveness? You have a half hour. I'm  
9 sure you can come up with the hard answers in that  
10 period of time.

11 (Laughter.)

12 DR. FINDER: Actually, if you want to take  
13 less, that's also okay. Fifteen minutes would be fine  
14 too.

15 MS. MARTIN: I just asked the question.  
16 I didn't ask the answer it.

17 (Laughter.)

18 CHAIRPERSON HARVEY: She shouldn't have to  
19 answer her own question, right?

20 DR. FINDER: Do any of the Committee  
21 Members have any questions before we begin? You don't  
22 have a lot of time. Let me just give you some

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 examples on some of the issues that have come up.  
2 People are asking us questions. When it comes to  
3 digitizers, two of the main ones are the following.

4 I want to take my film screen mammogram,  
5 put it in a digitizer, and then I want to store the  
6 film in that electronic format. I want to destroy the  
7 original. That's one issue. Another one that's come  
8 in is, I want to do the exact same thing but I'm going  
9 to keep the original someplace or I'm going to give it  
10 to the patient and let them keep it. Is that okay  
11 when I use my electronic version next year when I  
12 compare it against the original at that time?

13 The other is, I want to digitize this  
14 image and send it some place else to be read, the  
15 original interpretation at some remote site. Another  
16 factor on that one is, I'm going to send it someplace  
17 else. It's going to be read somewhere else. But it's  
18 also going to go through a CAD device.

19 How is all this going to impact? What's  
20 acceptable? What isn't? Those are the questions that  
21 if would you start dealing with that right now for the  
22 digitizer and spend a little time on that, then we'll

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 get into some more of the questions about compression  
2 which is a whole other issue.

3 DR. RAMOS: Yes, I am not a radiologist  
4 but just looking at the images that Dr. Phillips  
5 presented, I think that compression seems like a big  
6 deal. When you compare the images, obviously there is  
7 some data that is lost during the transition.  
8 Definitely I believe that someone, somewhere needs to  
9 keep the original of the digital image.

10 I think that the place that it may have  
11 more possibilities should be the institution. The  
12 moment that you put it somewhere else, you are losing  
13 something. There are possibilities there for losing  
14 some data. Just access all the time is a big issue.  
15 I don't believe that a lot of patients, a lot of  
16 facilities are going to have access to have the  
17 equipment that is going to be able to reproduce these  
18 images.

19 CHAIRPERSON HARVEY: Maryanne Harvey, I  
20 don't see how people can make decisions about this  
21 unless they do a study, a clinical trial. Otherwise,  
22 all you are doing is putting out your own biases or

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 thoughts on the matter. You need to have something  
2 more analytical I would say in order to do that. How  
3 can we find a way for some organization to support a  
4 study to see whether or not data is lost?

5 DR. KARELLAS: Andrew Karellas, we have  
6 been conducting a study in the past year or so. It's  
7 very preliminary and relatively narrow. But we have  
8 used human observers, radiologists, and also what is  
9 called numerical-type observers which is a  
10 mathematical calculation. We are finding some  
11 preliminary and very interesting aspects of image  
12 compression.

13 (1) Image compression today is not what it  
14 used to be ten years ago. The technology is advancing  
15 very fast. (2) We were surprised in that very limited  
16 set of data that you can actually compress  
17 mammographic images with simulated lesions to a great  
18 extent, meaning that perhaps you can do calcifications  
19 at a ten to one compression and masses up to 20 to one  
20 compression.

21 The statistical results showed  
22 equivalents. Again, the study has not been published

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 yet. So the validity of the study will have some  
2 weight when it is peer-reviewed and published. But  
3 the work has more or less been completed. But it  
4 addresses a very narrow part of the spectrum. I  
5 believe that other investigators will be looking into  
6 that. But it is not going to be anytime soon.

7 We checked very carefully to see who else  
8 is doing work in this area. Initially, we thought  
9 there would be a lot of people who had done a lot of  
10 work. There is much literature on image compression  
11 but not on digital mammography and not on patient-  
12 related imagery.

13 So you have all these mathematical papers  
14 out there, but as far as we know, there is very little  
15 that can give us the information that we need that we  
16 can say, "This is our recommendation that we want to  
17 make. There are these studies out there, four or five  
18 very high quality peer-reviewed papers. There appears  
19 to be a trend that it is safe to accept a certain  
20 level of compression." That of course may not include  
21 reversible, non-lossy compression. That might be a  
22 relatively easy decision to make if we are assured

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1       that there will be no loss of data.

2               DR. FINDER: Basically, to update you on  
3       what our guidance tries to say, we have accepted  
4       lossless or non-lossy compression in these areas. We  
5       have said, as long as you are not into the lossy  
6       field, we feel it's okay. And you are, from what I  
7       have been able to gather, able to get compression  
8       ratios of about three to four to one, in which, when  
9       you reconstitute that data, it is exactly the same as  
10      the original.

11              You cannot tell the difference. You can  
12      compare pixel by pixel, number by number. It's  
13      exactly the same. If we had some time, we could go  
14      into how there are certain mechanisms to do that.  
15      Some of them are fairly simple to understand because  
16      even I understood it when they explained it to me,  
17      being a radiologist.

18              (Laughter.)

19              DR. FINDER: So there are methods to do  
20      that. It's when we get into this lossy area that  
21      these issues become problematic because the data and  
22      the studies don't really seem to be there. At this

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 point, the question really is, for the uses that we're  
2 talking about - and there are various uses - one I  
3 think you can consider as counting this data, either  
4 the compressed data or the digitized data as the  
5 original.

6 If it's used for primary interpretation,  
7 should there be a certain requirement for that? Is  
8 there a lesser requirement if it's going to be used  
9 for a comparison of next year? But it won't be used  
10 for the original interpretation because that was read  
11 the year before. Another thing is, is there some kind  
12 of standard that we might consider for cases in which  
13 the images are sent to the referring physician who  
14 won't be doing really an interpretation but will be  
15 using this either to judge where the lesion is after  
16 it's been shown to them? Can there be these varying  
17 levels?

18 I will say that at least in terms of our  
19 regulations and the Act, when we're talking about at  
20 least the primary interpretation, we're saying the  
21 original film. That's probably the highest standard  
22 that we have to be careful about. And I'm not sure

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 that we really can make a distinction under our  
2 regulations or the Act when we're talking about  
3 comparison films because again our standard right now  
4 is the films and film screen systems have to be  
5 maintained for five or ten years so that comparisons  
6 can be done off of those originals.

7 We don't allow a facility to send a copy  
8 to another facility to be interpreted. We say they  
9 have to release the originals. So maybe those two  
10 were actually the same. But then there's the third  
11 one which is sending it to either referring physicians  
12 or patients or whatever for non-primary interpretation  
13 purposes. So there may be different levels. But  
14 certainly at the highest one, we're talking about the  
15 original.

16 DR. PHILLIPS: I just want to point out  
17 that you may be asking a question that you might not  
18 have to answer as time progresses, that is, how to  
19 address lossy compression. As I indicated and as you  
20 indicated, ten to 15 years ago, four to one was the  
21 limit for lossless compression.

22 With the newer algorithms that are being

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1       used, that number is going up, whereas the JPEG 2000,  
2       somewhere between ten and 40 is still considered  
3       lossy. That's a tremendous improvement in the  
4       database that you're trying to transmit and saves you  
5       a significant amount of time both in storage space and  
6       transmission time. So wait two years, you might not  
7       have to answer the question.

8                   CHAIRPERSON HARVEY: We'd like that.

9                   (Laughter.)

10                  DR. MARSHALL: Hi. My name is Julian  
11       Marshall. I'm from R2 Technology, a CAD provider. By  
12       way of background, currently our customers are  
13       scanning about eight million cases per year, 32  
14       million sheets of film. We quite frequently get  
15       asked, "Why can't I save all of this work that I'm  
16       doing scanning these films and use them for something  
17       useful in the future?"

18                  There are several things that they would  
19       like to do. They would like to get out of the  
20       quandary that they are placed in when they read  
21       digital mammography of having to put the prior  
22       mammogram on the lightbox orthogonal to their rather

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 dim monitors and 11,000 NIT lightbox and get out of  
2 this blast in the eyes to look at the priors, go back  
3 to the dim monitors and look at the images.

4 But if they can take a digitized film and  
5 put it up on the workstation, they can now do a much  
6 more spatially-related, temporal comparison between  
7 prior and current. I guarantee you they will prefer  
8 that reading environment.

9 Second of all, regarding film digitizers,  
10 they are not all the same. Just because they carry a  
11 510(k) approval doesn't mean that a radiologist would  
12 like the look of the mammogram that comes out of it.  
13 That's really noticed in a few different ways. Some  
14 of the digitizers exhibit what we call fixed pattern  
15 noise.

16 If you stretch the contrast up on the  
17 image that comes out of a digitizer, you see regular,  
18 geometric patterns completely unrelated to the  
19 original image itself that come from motor noise and  
20 other things. Scanners are electromechanical devices.  
21 They are prone to all the foibles of analog  
22 electronics.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1           In addition, if you look around the skin  
2       line on a mammogram, you will notice inability of the  
3       scanner to penetrate the film near the skin line. As  
4       manufacturers come out with films that are darker and  
5       darker, the problem gets worse and worse. So  
6       radiologists are going to have to get actively  
7       involved in evaluating the images that come out of  
8       digitizing systems to determine if it gives them the  
9       information that they want in the digital image.

10           Now, as it turns out, most of the people  
11       scanning films and thinking about future use of them  
12       are not thinking about, "I want somebody across the  
13       street to read that image in soft copy," although  
14       there are some applications of that. Most often they  
15       are thinking, "Next year, I want to go back and look  
16       to that image."

17           I think that gives you a very different  
18       set of goals. So if you consider that separately,  
19       when you digitize a relevant prior for display, you  
20       are largely not concerned with resolution anymore  
21       because you are not concerned about the morphology of  
22       little calcifications. Now, you are concerned about

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 the number of them. Has the number increased from the  
2 prior?

3 You are not necessarily concerned about  
4 the skin line because you still have the original  
5 image for your current examination there. That's  
6 where you are looking at the skin line. I think for  
7 the most part that digitized priors are going to be  
8 acceptable for soft copy reading in clinical practice.

9 Our company currently has several clinical  
10 studies going on in Europe investigating these very  
11 things, 100 micron digitization not 50 microns that we  
12 do normally for CAD purposes and so on. So those will  
13 be interesting results when they come out. I think  
14 that's it.

15 CHAIRPERSON HARVEY: Thank you.

16 DR. FINDER: Dr. Finder, I have a  
17 question. Do you know - and I don't know if you want  
18 to answer this question - what the effect of putting  
19 compressed data into your system would be?

20 DR. MARSHALL: The images that were shown  
21 of Lena - that's that woman's name by the way - if you  
22 look to the 40 to one JPEG 2000 compressed image, what

1 you noticed was largely the gestalt view. The picture  
2 looked much the same. But if you go and look in  
3 detail around the edge of the hat, you see paisley or  
4 some shape.

5 CAD algorithms internally divide largely  
6 into two things; looking for mass lesions, large  
7 structures, spiculations, lines, and so on and  
8 microcalcifications. One of the keys in  
9 distinguishing microcalcifications is the morphology  
10 of the microcalcification. Well, if you compression  
11 algorithm begins to add little paisley shapes,  
12 mandelbrot sort of looking things, it will impact the  
13 ability for the CAD algorithm to distinguish between  
14 one type of calcification and another.

15 Now, that's not to say that over time CAD  
16 algorithms couldn't develop insensitivity to that by  
17 training on enough cases that are one way or another  
18 way. The problem is that for the compression  
19 algorithms some are standardized - the JPEG 2000 kind  
20 are standardized - some are not.

21 There are a lot of companies out there  
22 with very clever mathematicians creating very clever

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 compression schemes that all do different things and  
2 leave different droppings in the images in different  
3 ways. The danger is that if images go through a  
4 proprietary compression algorithm, become uncompressed  
5 with damage left over, are then fed to a CAD  
6 algorithm, I don't believe the CAD vendors would  
7 probably guarantee the results that one would get from  
8 that process.

9 DR. FINDER: Thank you. Other questions?

10 CHAIRPERSON HARVEY: Dr. Karellas.

11 DR. KARELLAS: Andrew Karellas, I don't  
12 have a question. CAD is secondary although a very  
13 potentially important part at least of the whole  
14 screening process. But images may be viewed  
15 initially, go through CAD, interpreted, uncompressed.  
16 I believe that the compression schemes are best, at  
17 least in the next three years, for storage and  
18 communication.

19 Now, there is an exception to that. Of  
20 course, if you store them for a later time, the CAD  
21 becomes less important than the primary  
22 interpretation. However, if you do transmit the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 images for the CAD to be applied at a central  
2 facility, then that is a concern because the moment  
3 you transmit the images and they are compressed for  
4 the transmission part and then they want to use the  
5 CAD on the other side, then the issue that you are  
6 raising is of course value.

7 CHAIRPERSON HARVEY: Yes.

8 DR. REICHER: Murray Reicher. Hopefully  
9 these comments can be beneficial in clarifying. It  
10 seems like we're discussing two different things. One  
11 is digitizing. One is compression. We're tending to  
12 mix the two. Both processes have the potential to  
13 change an image.

14 Separating the topic of digitizing for a  
15 moment, the gentleman from R2 here and other vendors  
16 have been digitizing mammograms for quite a long time  
17 and have shown that their technology at least is able  
18 to detect even a single microcalcification with a  
19 digitized image. That's an uncompressed image.

20 So to that degree, we have millions of  
21 data points showing that one can digitize an image  
22 with a certain vendor's digitizer. Depending on

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1       whether you talk to R2 or ICAD or CADx or whoever it  
2       is, it will be a different one. And that image is  
3       reproduced faithfully enough that it can undergo  
4       computer analysis and see even a single calc.

5               So there's been quite a bit of testing on,  
6       is a digitized image equal to the original image?  
7       It's not identical. It can't ever be identical. But  
8       it seems like there's a lot of data showing that it's  
9       very close to identical.

10              There was a comment made about monitors.  
11       I just wanted to give the FDA something to reflect on.  
12       When the American College of Radiology ten years ago  
13       started writing standards for digital imaging, they  
14       came up with a monitor standard. I was on a committee  
15       a couple of years later. Everybody was kind of  
16       embarrassed when they realized that we came up with a  
17       monitor standard that was not resolution defined.

18              So there really needs to be a resolution  
19       standard. I think it's in the interest of the FDA and  
20       the general public to have a requirement that says  
21       that the image should be displayed at its full  
22       resolution at some point in the reading process and

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 that the software should promote that concept and that  
2 the rest should be, in my view, monitor independent.

3 If you look at all of the FDA cleared  
4 manufacturers' websites for high resolution monitors  
5 today, by irony, all of them have at least four  
6 mammograms up on each screen meaning that we're  
7 talking about data compression having a five or ten  
8 percent effect. Well, I would contend that a very  
9 high percentage - and I have observed a lot of them -  
10 of people today reading digital mammography may be  
11 displaying as little as one in four to one in 16  
12 pixels at the time of display because of multi-  
13 formatting.

14 So the monitor itself is irrelevant.  
15 What's relevant is something on that image that says  
16 it's being displayed at full resolution and something  
17 in the software that makes that happen easily.  
18 Furthermore, I think there's at least one vendor  
19 already that has a monitor independent software  
20 solution that's been cleared by the FDA where they  
21 provide a software-only PACS solution. The hospital  
22 IT department can buy any monitor they want to. I

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 don't know if that slipped through or was cognitively  
2 put through.

3 With regard to data compression, it also  
4 seems like we're talking about multiple topics. I  
5 have at least a dozen years experience with data  
6 compression. I'm not a physicist, but my  
7 understanding is that lossy versus lossless is  
8 mathematically defined but that there's another  
9 threshold of data compression that is mathematically  
10 lossless but visually non-lossless.

11 The image is identical. Original data  
12 can't be recreated. That may impact whether or not  
13 CAD can be used. But if the image has not changed, I  
14 think it's important that we have at least a common  
15 nomenclature to decide what that is. There's  
16 lossless. There's visually nondestructive. There's  
17 visually destructive.

18 There actually is a fair amount of non-  
19 mammography literature on visually nondestructive data  
20 compression that far exceeds, at least is two to three  
21 times what you can get with lossy data compression.  
22 That data is in human chest X-rays and generally

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealgross.com](http://www.nealgross.com)

1       accepted that you can go eight to ten to one without  
2       any radiologist or any machine for that matter really  
3       being able to detect a significant difference in the  
4       image.

5               The example at 40 to one between JPEG 2000  
6       and JPEG that was shown is a great example. But it  
7       has the potential to be misleading because I think the  
8       experience has shown that whereas JPEG 2000 creates  
9       blurriness and good old JPEG creates blockiness, both  
10      have about the identical threshold before they start  
11      degrading images. With regard to mammography,  
12      blurriness may be worse than blockiness.

13             So what I'm saying is, probably JPEG and  
14      JPEG 2000 don't differ in terms of what the actual  
15      number is. It's probably going to be somewhere  
16      between eight and ten to one before images start to  
17      change slightly.

18             So I think what colors all of my comments  
19      this week is that how the FDA acts and how the  
20      public's point of view is formulated depends on  
21      whether we enter this stage of time feeling like we  
22      have mammography being done pretty well and we have to

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 be very careful before we make any types of changes  
2 that could potentially screw things up, or whether we  
3 believe we have a national mammography crisis where  
4 four out of five days a week a woman may come in and  
5 have a mammogram read with 50 percent or less of the  
6 optimal sensitivity and we have to do something about  
7 it. Those are my last comments, I promise.

8 (Laughter.)

9 CHAIRPERSON HARVEY: Thank you. Yes, Dr.  
10 Karellas.

11 DR. KARELLAS: Andrew Karellas, just very  
12 quickly. Yes, as Dr. Reichert mentioned, there is a  
13 lot of literature on data compression and a lot of it  
14 in image compression and quite a significant body of  
15 image compression for chest and other modalities over  
16 the past 15 or 20 years. There is no question about  
17 that.

18 We do not have much on mammography. We  
19 have even less on digital mammography. So we just do  
20 not have enough data for digital mammography at this  
21 point. This may not mean that we have to wait for  
22 five or six years before any decisions are made. It

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 is possible to look into the literature for other  
2 examinations or modalities and try to derive certain  
3 conclusions and put together emerging data on digital  
4 mammography. But right now, we do not have much.

5 CHAIRPERSON HARVEY: Yes.

6 DR. MARSHALL: Julian Marshall of R2  
7 again. One comment back on the earlier statement you  
8 made Dr. Karellas on compressing microcalcifications  
9 at ten to one and masses at 40 to one. That's fine  
10 and good as long as you know in fact where the calcs  
11 are and you know where the masses are. You really  
12 can't even rely on CAD algorithms to tell you that  
13 because it's not an exact science. So how one would  
14 make the determination of how to compress which part  
15 of the image would be interesting I think.

16 I wanted to just mention briefly we have  
17 always taken a very conservative view on compression.  
18 Until recently, we did no compression at all for the  
19 simple reason that I think our customers are not ready  
20 to go to compression. If you talk to mammographers,  
21 they are very concerned about the fineness and the  
22 detail and the minutia of the images and the accuracy

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 of what they are looking at, the quality of the images  
2 and so on.

3 So we internally have not done any  
4 compression at all. We are now beginning to, as Bob  
5 Phillips alluded to, do compression on transmission.  
6 That means the images get lossless compressed as they  
7 are transmitted and they are reexpanded at the other  
8 end. But it has no impact on the actual pixel data  
9 whatsoever. That's just a normal part of DICOM and  
10 medical imaging every day. But other than that, I  
11 don't foresee us using any lossless compression at all  
12 for years to come.

13 One cautionary note on storing mammograms  
14 in your PACS with any sort of lossy compression. One  
15 thing that's coming down the road for CAD - maybe not  
16 very quickly but it's coming - will be the time when  
17 CAD algorithms begin to look at temporal change. So  
18 the CAD algorithm will look at the current mammogram,  
19 look at the prior mammogram, and say this is different  
20 than that. If you introduce compression artifacts to  
21 the priors, you may not have the advantage of being  
22 able to do that. So that's one cautionary note.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 DR. KARELLAS: Andrew Karellas, yes, I  
2 totally agree. The compression at 32 on for masses  
3 and much less than that for calcifications is a  
4 hypothesis. I'm not aware of any data or at least we  
5 do not have any data that indicates that it's safe to  
6 do that with clinical images.

7 All we have done is extremely limited  
8 under relatively narrow conditions. All we are seeing  
9 is that this is a very interesting area to explore  
10 because we feel that if we can break through these  
11 barriers some years from now, some years from now, we  
12 might be able to use image compression to our  
13 advantage.

14 DR. FINDER: Just trying to move things  
15 along, I do have a specific question that we received.  
16 I just wanted to get the Committee's opinion on it.  
17 In the situation where a facility decides to digitize  
18 film screen image and only use it for specific  
19 purposes such as for comparison for next year or for  
20 use with referring physicians and they are going to  
21 keep the original - so the original is going to be  
22 somewhere and it may not be in their files but with

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 the patient - would that be acceptable or do we worry  
2 about the fact that if they are going to be using it  
3 for comparisons we're letting the cat out of the bag  
4 already at that point? Is anybody concerned about  
5 that?

6 MS. MARTIN: I'm not concerned. That's  
7 exactly the scenario I got asked to bring here because  
8 that's what they are wanting to do. That's exactly  
9 what they are wanting to do. Like the gentleman said,  
10 you don't want those bright lights and the dim  
11 monitors.

12 CHAIRPERSON HARVEY: Dr. Karellas.

13 DR. KARELLAS: Andrew Karellas, however,  
14 provided when they do that, they do it in the proper  
15 way. While Dr. Phillips mentioned that they are FDA  
16 approved devices, I believe it was not for mammography  
17 other than CAD. But it has to be done in a proper  
18 way. I would be concerned about digitizing film in a  
19 poor fashion.

20 Although the film is stored, it's not  
21 really being used and you may be using the poorer  
22 quality. But if it is done very well and there are

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 certain good guidelines for doing it and there is  
2 compliance with the guidelines, perhaps it may be an  
3 acceptable way of doing it.

4 DR. FINDER: Well, I would say that none  
5 of these units as far as I know have been sold for  
6 that purpose and have been cleared for that purpose.  
7 So we run into certain issues about, if we approve it  
8 for use like this when it hasn't been approved for  
9 sale, there are issues there also.

10 CHAIRPERSON HARVEY: Yes.

11 DR. THOMAS: Jerry Thomas, I have looked  
12 very critically at all digitizers but not in terms of  
13 mammography. I'll share a couple of comments. A Dmax  
14 runs around 3.5. If you have a mammography image with  
15 a Dmax greater than 3.5, you are going to lose that  
16 information. It will not digitize. Dmin is around  
17 two and a quarter, probably 0.25 on those. Not two  
18 and a quarter, I'm going the wrong direction here.

19 DR. FINDER: Would you just explain that  
20 you are talking about density?

21 DR. THOMAS: Yes, okay, the optical  
22 density range that it will digitize, its dynamic range

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 ranges from 0.25 to 3.5 on the ones that I have looked  
2 at. The technical design of them are such that you  
3 are not going to see a substantial shift. If it  
4 shifts, it's going to shift the entire range so the  
5 minimum optical density is going to be higher than  
6 0.25 if the Dmax digitized goes higher. I don't not  
7 believe that any of the digitizers can go above about  
8 3.7, if that high.

9 The second thing that was mentioned by  
10 Julian is very important, that is, in the black, there  
11 is an incredible amount of noise in most of the CDC-  
12 based digitizers. There's been a lot of improvements  
13 in the last few years, but it's still very noisy. I  
14 just came from teaching a course this past Saturday in  
15 your part of the world. I was asked this question by  
16 about 15 technologists. When can we start digitizing  
17 our existing screen film?

18 That's important in terms of the  
19 transition from screen film to digital interpretation.  
20 At this point in time, we're going to have substantial  
21 numbers of missed cancers and diseases looking at soft  
22 copy disk play where I have an illuminator sitting

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 next to it because of the bright light that's coming  
2 from the illuminator and the failure of the  
3 radiologist to be able to adjust between two different  
4 luminance levels from those viewing devices.

5 For general mammography though, I'll  
6 finish by saying that our CAD companies have proven  
7 the effectiveness of film digitization. Their  
8 algorithms are very sensitive. The average luminance  
9 within a mammography image until we get to the skin  
10 line falls within the capabilities of the digitizers.

11 So it makes perfect sense within certain  
12 guidelines and regulations or I should say within  
13 certain digitization standards in terms of the  
14 performance standards of the device to allow something  
15 like that to happen. But one has to be very critical  
16 in terms of the dynamic range as well as what the  
17 noise is within the blacks. Thank you.

18 CHAIRPERSON HARVEY: Thank you. Any more  
19 comments? Do you have what you need, Dr. Finder?

20 DR. FINDER: Yes.

21 CHAIRPERSON HARVEY: Thank you. Thank you  
22 to everyone who contributed to that discussion. Dr.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 Barr has a few statistics that I asked her to gather  
2 earlier in my concern for our ability to meet capacity  
3 needs into the future.

4 DR. BARR: Helen Barr, FDA, first of all,  
5 while I am up here giving you these, I wanted to take  
6 the opportunity which I didn't do earlier to thank  
7 everyone on the Committee for his or her time. I know  
8 that you are all busy people with responsibilities  
9 elsewhere. On behalf of the agency, I want to tell  
10 you how much your time is appreciated. I'll give you  
11 these statistics. Then I want to pose one question to  
12 Dr. Finder. That will just give him a few minutes to  
13 worry while I give you these statistics.

14 DR. FINDER: You don't have to ask the  
15 question here. We can talk about it back in the  
16 office.

17 (Laughter.)

18 DR. BARR: No, we have to talk about it  
19 here. I gave you the statistic that as of April 1,  
20 2004 there were 9,079 mammography facilities.  
21 Maryanne Harvey asked me if I could reiterate what the  
22 trend in that has been over the years. Then I'll give

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 you the units.

2 In October 2000, we had 9,933, October  
3 2001, 9,558, October 2002, 9,306, and October 2003,  
4 9,114. The units is a little more difficult for me to  
5 tell you about. I'm just going to actually give you  
6 the last time we did the units in November '03 and  
7 I'll tell you why. First of all, I told you that on  
8 April 1 - or I didn't get a chance to tell you this  
9 but Maryanne asked me - to compare with that 9,079  
10 facilities, there were 13,643 units or an average of  
11 about 1.5 units per facility. In November '03 to  
12 correlate with that 9,123 facilities, there were  
13 13,632 units.

14 The reason I'm not going to go further  
15 back in the units is in November we changed how we  
16 looked and counted the units. We used to count  
17 inspected units. Then we said to ourselves, "Well, if  
18 we're really looking at capacity - and people want to  
19 know the units these days really because of capacity  
20 access issues - that we should really count all units  
21 out there that are in service, have been accredited  
22 and are in service but perhaps haven't been inspected

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 yet."

2 So that's why. Going back, it's going to  
3 look like we had a big jump in units when we actually  
4 changed the way we looked at them. So we can go on  
5 from last November.

6 Charlie, the one question I wanted to pose  
7 to you, which is for own my learning purposes and for  
8 the Committee, something that came up today was about  
9 the viewboxes. Now, I can't imagine that the original  
10 people who dealt with MQSA regs when they were being  
11 developed just totally forgot about viewboxes. You  
12 know me, I love to go back in history and see.

13 Assuming we must have made a conscious  
14 decision before to leave viewbox out of the  
15 regulations, I just wonder if you could bring us up to  
16 speed on what some of the stumbling blocks were or  
17 reasons were, not that I don't want to go back and  
18 visit things. Then before you answer that, I just  
19 wanted to say one thing so I can go sit down while you  
20 answer.

21 You asked about stereotactic. Dr. Finder  
22 and I have discussed that we will add a future NMQAAC

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 meeting. I can't promise it will be the next one but  
2 adding a NMQAAC meeting in the future will give people  
3 the opportunity to talk about stereotactic and their  
4 thoughts on that. Okay, go ahead.

5 DR. FINDER: Regarding viewboxes, it  
6 wasn't forgotten about. It was discussed. They were  
7 talking about a lot of issues at the time including  
8 checking the eyesight of the individual radiologists.  
9 I'm not kidding. That was part of it because you are  
10 talking about visual acuity and everything else.

11 The problem was that there wasn't full  
12 agreement on what the standards should be and how you  
13 should check against them. At that time, there was  
14 the big issue about, should you be reading on a  
15 dedicated memo viewbox with higher light levels than  
16 the standard viewbox? There was no consensus on that.  
17 In fact, some of the data seemed to show later that  
18 maybe because of this issue about the light hitting  
19 your eyes, you actually might be making your problems  
20 even worse by having these high intensity viewboxes.

21 We did however address some of it. We did  
22 say that facilities were required to have masking

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 materials available to address the issue of the  
2 extraneous light coming from the viewbox and that all  
3 facilities had to have hotlights available. But we  
4 didn't get into the specifics of how often they were  
5 supposed to be cleaned or what the luminescence had to  
6 be or any of those specific issues because at the time  
7 we weren't able to come up with a requirement that  
8 could adequately be tested and inspected against.

9 It's certainly something to consider. The  
10 ACR has guidelines about what they believe are  
11 recommendations for that. But we didn't put it in a  
12 regulation at the time. It's certainly something we  
13 can consider again. But if we're done with that, I  
14 did want to get into some of these guidance questions  
15 which address some of the issues that we talked about  
16 earlier that I know are of some interest.

17 I do want to mention the fact that for  
18 those who aren't aware we have put all our guidance  
19 into what's called the Policy Guidance Help System  
20 which is available on the Internet. The last time I  
21 looked, if you typed out all of the pages, it's  
22 somewhere around five to six hundred or so pages. We

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 are in the process of actually going through that  
2 entire mass of information and updating it.

3 I was hoping to be able to present at  
4 least some of that here at the time, but it hasn't  
5 gone through the full clearance process yet. It's  
6 still working its way through the system. So maybe at  
7 the next meeting we'll be able to talk a little bit  
8 more about it. But I do have a couple of specific  
9 questions that have come up and wanted the Committee's  
10 opinion on.

11 One of them, clairvoyantly I must admit,  
12 was this business about scanning paper records, QC  
13 records, and personnel documents so that they could be  
14 used for inspections or whatever purpose the facility  
15 had. We were talking about scanning in the QC  
16 records, the mammography equipment evaluations, the  
17 annual physics surveys, all the personnel  
18 documentation, all the paper records in effect.

19 Then they could be used either transmitted  
20 back and forth between a central site for the  
21 inspection of the facility or the facility could use  
22 them just at a single site. The question that we were

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 really having is, I don't think anybody has any issue  
2 about scanning those documents in and using them for  
3 various purposes. One of the issues though that we  
4 did try and come up with or had a concern about was,  
5 does the facility have to maintain at least some of  
6 these records in hard copy, original form?

7 I just wanted to try and get the  
8 Committee's idea about records that are generated by  
9 the facility itself. So those would basically be the  
10 QC records, issues like that. Is there a feeling that  
11 those QC tests that were done by the facility's  
12 technologist, should they be maintained in their  
13 original format?

14 The reason I bring that up is for the very  
15 small chance that there is an issue later on about  
16 falsification of records. There are ways to determine  
17 whether a record has been falsified if you have the  
18 original versus you lose some of that if it becomes  
19 scanned in or copied like that. Any thoughts?

20 DR. KARELLAS: Andrew Karellas, if a  
21 facility has both digital and paper, it defeats the  
22 purpose of streamlining the operation. There may be

**NEAL R. GROSS**

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 certain documents that for one reason or another  
2 cannot be scanned. That's particularly the case with  
3 QC films that we do, phantom images, collimation  
4 assessment, that you save them. That one can be saved  
5 as a hard copy.

6 But if we start saving processor records  
7 and certificates of attendance, I think that we're  
8 defeating the whole purpose. I believe somebody can  
9 falsify a certificate of attendance perhaps just as  
10 easily as they can falsify any other document.

11 DR. FINDER: Yes, we weren't talking about  
12 keeping a hard copy of CME certificates or anything  
13 like that because they were an original to the  
14 facility anyhow. The only thing we were talking  
15 about, if anything, was to save the original paper,  
16 like charts for the QC records that were generated at  
17 the facility if that's felt to be important.

18 I would also add that our feeling was that  
19 the facility would still have to be able to at least  
20 generate a hard copy if the inspector needed it for  
21 documentation purposes and things like that. But yes,  
22 our feeling is to try and move as much as we can into

**NEAL R. GROSS**

WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 the electronic world.

2 MS. RIGSBY: Amy Rigsby, I hate to say  
3 this but if somebody is going to cheat, it doesn't  
4 matter how perfect or how wonderful the system is.  
5 They are going to cheat somehow if they are going to.  
6 I don't know if that should be a consideration or not.  
7 If they are going to, they are going to.

8 CHAIRPERSON HARVEY: Ms. Martin.

9 MS. MARTIN: The only thing I can think of  
10 to add is to highly recommend that they back it up so  
11 that they don't have a single copy on hard disk of  
12 their QC records.

13 CHAIRPERSON HARVEY: Whoops, there goes  
14 the month.

15 MS. MARTIN: Yes.

16 DR. FINDER: That actually is a very good  
17 point because the number of citations might go up  
18 quite significantly as soon as the power spikes.

19 (Laughter.)

20 MS. MANN: Are some places out there  
21 already doing their QC electronically? Then they  
22 would just have to print it to have a printed record.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 So it probably would make sense for them to just leave  
2 it electronic.

3 DR. FINDER: Right.

4 MS. MARTIN: The Kodak system is  
5 electronic. We have facilities that have been totally  
6 electronic for a couple of years now at least with all  
7 their QC. They just print it out as needed if the  
8 inspector wants a copy. They have no paper copies.

9 DR. FINDER: Right, and we would address  
10 that issue in guidance by saying that those records  
11 that are electronically generated would be that. They  
12 wouldn't have to necessarily print them out unless the  
13 inspector needed to make a copy for whatever reason.

14 CHAIRPERSON HARVEY: Dr. Ramos.

15 DR. RAMOS: Yes, Catalina Ramos. This is  
16 a question. If you have the original record in hard  
17 copy but you are going to move it electronically, does  
18 it have any HIPAA implications that you need to  
19 request?

20 DR. FINDER: This is Dr. Finder. None of  
21 these records are patient records.

22 DR. RAMOS: Okay.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 DR. FINDER: It's QC records so as far as  
2 I can tell, there is no HIPAA issue.

3 CHAIRPERSON HARVEY: Ms. Martin.

4 MS. MARTIN: I really highly recommend  
5 they actually scan it in. We had a facility that lost  
6 nine months of their QC records when their QC tech got  
7 mad and left and took all of the QC data with her. So  
8 actually it would have been much to the benefit of the  
9 facility if they had a scanned copy of that QC data.

10 CHAIRPERSON HARVEY: Unless she erased the  
11 program.

12 DR. FINDER: I think now instead they are  
13 going to walk off with the laptop.

14 CHAIRPERSON HARVEY: That's right.

15 (Laughter.)

16 DR. FINDER: So I'm not sure it's going to  
17 help much. Another question that we have gotten  
18 recently. As you are well aware under our regulations  
19 in the law, patients are required to be sent lay  
20 summaries, summaries of their results from their  
21 mammograms. We recently got a request from a facility  
22 where the patients specifically do not want to be sent

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 the lay summary.

2 Our question is, how do we handle that  
3 situation? Do we want to go against the patient's  
4 specific request? Do we want to have the facility go  
5 against that request? If we don't, what type of  
6 measures do we require or should we require to ensure  
7 that this won't be abused by facilities that really  
8 just don't want to send them out and they are going to  
9 convince their patients not to ask for them or  
10 something like that? Has anybody else heard of this  
11 issue?

12 MS. MOUNT: Carol Mount, we have had the  
13 same situation. It's not frequent, but the patient  
14 just does not want that letter sent to her home. So  
15 we will manually pull it out and deliver it via  
16 interclinic mail to her physician who will then hand  
17 it to her. But it's very infrequent that it happens.

18 DR. FINDER: We have a slightly different  
19 situation where the patient specifically states she  
20 doesn't want to get it at all. She doesn't want it  
21 sent. She doesn't want to receive it. Should we tell  
22 the facility that they are not to honor the patient's

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 request or what?

2 DR. HARRISON: Miles Harrison, we have had  
3 similar situations to that and we have done it the  
4 same way. In that particular case, that lay record  
5 goes along with the technical report and my office  
6 chart. So you have satisfied both sides of it. You  
7 did not send a report to a person who didn't want it.  
8 The report still exists and is discoverable.

9 DR. FINDER: All right, and do you happen  
10 to know if the facility had the patient sign anything  
11 specific to that request to indicate that or no?

12 DR. HARRISON: Again, I'm the surgeon and  
13 not the radiologist. As far as I know, I have not  
14 been made privy to any signature in the radiology  
15 department that released them.

16 CHAIRPERSON HARVEY: Dr. Timins.

17 DR. TIMINS: Julie Timins, I would imagine  
18 you would need the patient to sign a release for that.

19 MS. PURA: Linda Pura, you could have the  
20 patient sign the release, but I would recommend that  
21 in your documentation somewhere that you write in  
22 there that this was explained to the patient and this

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 was the outcome and then have whoever did the  
2 explanation sign that off.

3 DR. FINDER: Okay, any other comments?  
4 All right, another quick question. It's a quick  
5 question. I don't know how quick the answer is. We  
6 had a number of issues that have come up with small  
7 field digital mammography. These are digital image  
8 receptors that were basically originally designed for  
9 use in interventional, but they can also be used in  
10 some standard mammographic units for diagnostic work.

11 But because of their size, you cannot do  
12 a full mammogram. You are only looking at a small  
13 portion of the breast. Therefore, these can only be  
14 used for diagnostic-type work. So in the past, what  
15 we have done is we have said that these small  
16 receptors do not require their own accreditation.  
17 They are used as part of an otherwise accredited unit.  
18 They don't have to go through a separate accreditation  
19 because there's no clinical image review for these  
20 things.

21 We have also said that these receptors, if  
22 they are going to be used for diagnostic work, would

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 have had to have already gotten clearance from the  
2 FDA's Office of Device Evaluation so that in their  
3 clearance it states that they can be used for  
4 diagnostic work. A lot of them in the beginning were  
5 only approved for interventional-type studies.

6           However, we now come up to the question,  
7 should we include small field digital as some  
8 subsegment of full field digital in terms of personnel  
9 qualifications, in the sense that, should we be  
10 requesting that people who use these units get some  
11 type of training in digital, the eight hours of  
12 initial training? Leave it at that. Should they?

13           CHAIRPERSON HARVEY: Ms. Martin.

14           MS. MARTIN: I know those units that he's  
15 talking about. It's a very different set up than a  
16 full field digital. I think somehow they do need to  
17 go through the manufacturer's training, and yet  
18 obviously if the technologist that goes through the  
19 training today leaves tomorrow.

20           My facilities certainly have not had eight  
21 hours of the equivalent of full field digital to use  
22 those little diagnostic units. They may have had an

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 hour extra from the in-service from the manufacturer.  
2 But they are basically following the QC program from  
3 the manufacturer and that would be the extent of it.  
4 And I felt comfortable with that.

5 CHAIRPERSON HARVEY: Any other experience?

6 MS. MOUNT: Carol Mount, just throwing a  
7 question out, when techs are trained stereo, they  
8 record those credits. That's basically the same thing  
9 only it's upright as opposed to prone.

10 DR. FINDER: I guess the issue is, if we  
11 include it as part of a mammographic modality, we can  
12 require some type of training. If we say it's  
13 somewhere in the limbo, it's nowhere, we can't do  
14 anything in terms of requiring any type of training.  
15 It always becomes an issue of, where does this fit in?  
16 In the past, we have left it moot. But we're getting  
17 more and more questions about this. The question is,  
18 do we address it and how do we address it?

19 CHAIRPERSON HARVEY: Dr. Karellas.

20 DR. KARELLAS: Andrew Karellas, some of  
21 these devices can produce very good image quality. On  
22 occasion, having the right device can be very useful

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 because they have very small pixel size. So  
2 radiologists are often very high on using those for  
3 calcifications because you can see it very well.

4 However, it does raise the potential for  
5 overexposure here because being digital you can crank  
6 the exposure up. The more you give, the better the  
7 quality of the image. So that does raise a red flag.  
8 People must be trained to use digital. I would not  
9 recommend people who are used to doing just the film  
10 screening go on to the digital receptor without any  
11 training for that.

12 DR. FINDER: Is that the general consensus  
13 of the Committee?

14 CHAIRPERSON HARVEY: Yes, I think.

15 DR. FINDER: Okay, well, just to go on  
16 that a little bit more, would you say that if somebody  
17 who had already gotten eight hours of FFDM training  
18 that that would count toward the small field digital?

19 DR. KARELLAS: I would think that would be  
20 fair. The one concern I have is with automatic  
21 exposure control because I would have to know exactly  
22 how every one of these devices operates. If it is

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 purely in the manual mode, that means that you can  
2 give any exposure you want. I do not know the  
3 specifics about every single of these devices. But I  
4 think it's fair to say that if you have all the  
5 requirements for the digital, that would be adequate,  
6 perhaps barely adequate, for the small field.

7 DR. FINDER: What about the following  
8 situation? These small field digital receptors have  
9 been around for a large number of years. Any  
10 consideration to grandfathering in people who have  
11 been using them for a long period of time?

12 MS. MARTIN: I wouldn't have a problem  
13 with that because I know all my facilities that have  
14 been using them. We have technique charts posted for  
15 these small field receptors. We measure the dose on  
16 the small field receptors with the phantom. So your  
17 physicist has checked it out. There's a posted  
18 technique chart. They have received manufacturers  
19 training. I don't see why we wouldn't allow them to  
20 go ahead and use them.

21 DR. HARRISON: And these have been  
22 available for many years. It would seem to me we're

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 just simply trying to document that indeed the  
2 technologist had their baseline training. That would  
3 be inclusive it sounds like to me.

4 MS. MOUNT: Carol Mount, I would see  
5 grandfathering them in. It's just my gut feeling and  
6 it's just my opinion, but I don't think we're going to  
7 see a lot more of those out there with full field  
8 digital out there. I think people are going to buy  
9 that instead. So to grandfather in the current ones  
10 would be a good idea.

11 DR. FINDER: Those were the questions that  
12 I had.

13 CHAIRPERSON HARVEY: Excellent. We have  
14 come to the last item on our agenda today which is the  
15 review and approval of the summary minutes from our  
16 previous meeting which was last April 2003. It seems  
17 like just yesterday. Does anyone have any  
18 recommendations, changes, and/or other comments they  
19 wanted to make about the previous minutes? If not, I  
20 would entertain a motion to approve them.

21 MS. MARTIN: So moved.

22 CHAIRPERSON HARVEY: May I have a second?

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1 DR. KARELLAS: Second.

2 CHAIRPERSON HARVEY: Second, all right,  
3 excellent. The next item has to do with future  
4 meetings. Dr. Finder.

5 DR. FINDER: Well, I remember last year at  
6 this time I was saying the exact same thing. We  
7 expected to have a meeting in the fall. It didn't  
8 quite work out that way this time. But we do expect  
9 to have another meeting in the fall. Probably what  
10 we're going to be talking about is a further  
11 continuation of some of the issues that may pop up  
12 with reauthorization because that still is an ongoing  
13 process. That would be my expectation.

14 The other thing is, as I mentioned, we are  
15 working on revising the guidance. Some of the  
16 questions that I just spoke with you about here will  
17 probably be incorporated into a future guidance  
18 document. If we have to go through the entire Policy  
19 Guidance Help System and revise that, we may be  
20 talking about a huge document which may take up a lot  
21 of time to go over but it may be a topic of discussion  
22 at that meeting.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1                   We are lucky in one sense that the people  
2                   who are here are actually going to be on the Committee  
3                   in the fall. So does anybody have any specific times  
4                   when they would like or can't make, if they know that  
5                   ahead of time, if there are any big meetings coming up  
6                   or anything like that? Obviously what's going to  
7                   happen when we get down to the nitty gritty of it, the  
8                   details, I'll send out, like I did the last time, a  
9                   fax or email asking for your availability. But if you  
10                  know at this point that there are going to be some  
11                  issues, we might as well find that out right now.

12                 DR. TIMINS: I won't be around the first  
13                 three weeks of October.

14                 DR. FINDER: October.

15                 DR. HARRISON: I want to know when the  
16                 Redskins are in town.

17                 DR. FINDER: Yes, we do usually get  
18                 requests for when Redskins games are and also the nice  
19                 weather. Look, I tried my best this time.

20                 CHAIRPERSON HARVEY: You did a good job.

21                 DR. FINDER: I missed cherry blossoms by  
22                 a little bit, but you can't ask for everything.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealgross.com](http://www.nealgross.com)

1 Usually the first week or so in October is always bad  
2 because you never know if the government is going to  
3 be funded at that time. So we try and stay away from  
4 that. We either try and get it in September or later  
5 on in October or early November. I try and keep it  
6 from getting too far into the winter because we have  
7 had snowfalls and things like that which make  
8 traveling problematic.

9 CHAIRPERSON HARVEY: Then will we have the  
10 minutes to get to.

11 DR. FINDER: Yes, in terms of the minutes  
12 of this meeting, we will be sharing those with the  
13 Institute of Medicine. I'll be happy to pass along  
14 everything that we have said here. They will also  
15 have the transcript. I'm sure they are going to be  
16 talking to us and maybe individual Committee Members  
17 if they care to. So I would assume we're going to be  
18 talking about some time in the fall. I will send out  
19 additional information when it becomes available.

20 CHAIRPERSON HARVEY: Excellent. Any other  
21 comments from any members? Thank you for coming and  
22 for a productive meeting. This meeting is adjourned.

**NEAL R. GROSS**
